

Inorganic Halides

Halides are inorganic compounds in which one part is a halogen atom with negative charge, and the other part is an element or radical that is more electropositive than the halogen. Metal halides are used in high-intensity discharge lamps. Metal halide lamps are also commonly used in greenhouses or in rainy climates to supplement natural sunlight. Silver halides are used in photographic films and papers. Halides are also used in solder paste, commonly as a Cl or Br equivalent.

Bromates & Bromites

A bromate is a chemical compound that contains the bromate anion, BrO_3^- . Examples of bromates include sodium bromate, silver bromate, strontium bromate, calcium bromate, and potassium bromate. Bromates are used as valuable oxidizing agents and brominating agents in analytical chemistry. Silver bromate is an oxidant for converting tetrahydropyranyl ethers into carbonyl compounds. Potassium bromate is used in woolen textile finishing. Sodium bromate is effective as an additive for the finishing of metal surfaces by phosphoric acid.

Inorganic Fluorides

The inorganic anion of fluorine (F^-) is called fluoride. The fluoride ion can form various inorganic compounds such as calcium fluoride, sodium fluoride, aluminum fluoride, potassium fluoride and magnesium fluoride. Bifluorides are also known to form with metals. Fluoride ions occur on earth in several minerals, particularly fluorite. Sodium fluoride was the first chemical used for fluoridation. Salts of fluoride are widely used as important chemical reagents and industrial chemicals, mainly used in the production of hydrogen fluoride for fluorocarbons. Fluoride is the most bioavailable form of fluorine. Fluoride is necessary micronutrient for human health to prevent dental cavities and widely used as promoter for bone growth.

Fluoride is used in the manufacture of cryolite, Na_3AlF_6 , which is required for aluminium smelting. Topical and systemic fluoride therapy is used for preventing tooth decay. Fluoride salts are commonly used in biological assay processing to inhibit the activity of serine/threonine phosphatases. Beryllium fluoride and aluminium fluoride are also used as phosphatase inhibitors. Bifluoride salts (HF_2^-) are used to etch glass surface. Some examples of bifluoride salts are ammonium bifluoride and potassium bifluoride. In analytical chemistry, the lanthanum fluoride electrode, which is an ion selective electrode containing lanthanum fluoride and europium fluoride, is very sensitive to the concentration of fluoride ions.

Chlorates & Chlorites

Chlorates are chemical compounds containing the anion having the formula ClO_3^- . In these compounds, chlorine atom is in the +5 oxidation state. Chlorates are the salts of chloric acid and are very strong oxidizers. Chlorates can be used as a source of oxygen. Mixtures of chlorate salts with virtually any combustible material (sugar, sawdust, metals, etc.) will readily deflagrate. Most pyrotechnic applications which formerly used chlorates in the past now use the more stable perchlorates instead. Sodium chlorate is used to manufacture chlorine oxide. Chlorates are used in the manufacture of dyes, matches, fireworks, disinfectants, and for tanning and finishing leather.

Inorganic Iodides

Compounds with iodine in formal oxidation state +1 are called iodides. The iodide ion, I⁻, is one of the largest monoatomic anions. Examples include ionic compounds such as cesium iodide, potassium iodide, magnesium iodide, zinc iodide and silver iodide. Iodide can function as a nucleophile and an antioxidant reducing species that can destroy reactive oxygen species such as hydrogen peroxide.

Iodide salts are mild reducing agents and many react with oxygen to give iodine. Iodide compounds are used in photography, lithography, electroplating, manufacture of phosphors, Grignard reactions, and cloud seeding. Magnesium iodide in the Baylis-Hillman reaction gives (Z)-vinyl compounds (Tietze, Lutz-Friedjan, et al., Domino Reactions in Organic Synthesis, Wiley-VCH, 2006, 59). Copper iodide is useful in the exchange of bromides attached to sp² carbon atom in organic compounds with iodides. NaI is useful in the aromatic Finkelstein reaction. Among halides, aryl iodides are preferred to form carbon–carbon and carbon–heteroatom bonds in process such as the Heck, Stille, Sonogashira and Suzuki coupling reactions. Cobalt(II) iodide is used as a catalyst in carbonylations. It catalyzes the reaction of diketene with Grignard reagents, useful for the synthesis of terpenoids. Strontium iodide finds use as a scintillation gamma radiation detector. Cesium iodide is often used as the input phosphor of an x-ray image intensifier tube, & as beam splitter in Fourier Transform Infrared (FT-IR) spectrometers. CuI is used in the detection of mercury vapors through visual color change into brown. Zinc iodide is often used as an x-ray opaque penetrant in industrial radiography

Inorganic Bromides

Inorganic bromides are group of compounds that contain a bromide ion or ligand with an ionic charge of -1, and a more electropositive element or radical. Bromide is commonly found in nature along with sodium chloride. Most metal bromides are water soluble; exceptions are bromides of copper, lead, mercury, and silver, which are very slightly soluble in water.

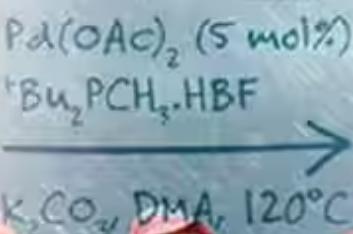

Potassium bromide and sodium bromide are the familiar bromides used in medicine as sedatives. Magnesium bromide, found in seawater, is a source of pure bromine. Silver bromide is one of the light-sensitive silver salts used in films, plates, and printing papers for photography. The bromide ion is antiepileptic, and bromide salts are still used as such, particularly in veterinary medicine. Bromide is used as treatment for bipolar disorder. Bromide is needed by eosinophils, which use it to generate antiparasitic brominating compounds such as hypobromite. The bromide ion is a water disinfectant byproduct when ozone, or possibly hypochlorite (bleach), is used as a disinfectant. The bromide ion itself is sometimes used as a water disinfectant because in water it forms hypobromous acid (HOBr), which is a strong disinfectant.

Iodates & Iodites

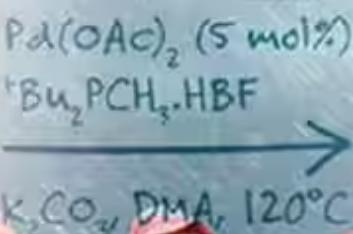

Iodates are a class of chemical compounds containing a IO_3^- group. An iodate is a conjugate base of iodic acid. Examples are sodium iodate (NaIO_3), silver iodate (AgIO_3), and calcium iodate ($\text{Ca}(\text{IO}_3)_2$). Potassium hydrogen iodate ($\text{KH}(\text{IO}_3)_2$) is a double salt of potassium iodate and iodic acid. Iodate salts are used in the iodine clock reaction. Potassium iodate has been issued as a prophylaxis against radioiodine absorption, & to protect against accumulation of radioactive iodine in the thyroid.

Inorganic Chlorides

Chlorine forms compounds with the other halogens and with oxygen; when chlorine is the more electronegative element in the compound, the compound is called a chloride. The salts of hydrochloric acid contain chloride ions and can also be called chlorides. The word chloride can also refer to a chemical compound in which one or more chlorine atoms are covalently bonded in the molecule. The simplest example of an inorganic covalently bonded chloride is hydrogen chloride, HCl. Chloride is also a useful and reliable chemical indicator of river / groundwater fecal contamination, as chloride is a non-reactive solute and ubiquitous to sewage & potable water. A chloride ion is also the prosthetic group present in the Amylase molecule.

A chloride test measures the level of chloride in human blood or urine. Chloride is one of the most important electrolytes in the blood. It helps keep the amount of fluid inside and outside of your cells in balance. It also helps maintain proper blood volume, blood pressure, and pH of human body fluids. Most chlorides are salts that are formed either by direct union of chlorine with a metal or by reaction of hydrochloric acid with a metal, a metal oxide, or an inorganic base. Chloride salts include sodium chloride, potassium chloride, calcium chloride and ammonium chloride. Most chloride salts are readily soluble in water, but mercurous chloride (calomel) and silver chloride are insoluble, and lead chloride is only slightly soluble. Some chlorides such as antimony chloride and bismuth chloride decompose in water, forming oxychlorides. Many metal chlorides can be melted without decomposition; two exceptions are the chlorides of gold and platinum. Most metal chlorides conduct electricity when fused or dissolved in water and can be decomposed by electrolysis to chlorine gas and the metal.

	18682	Yttrium(III) chloride, anhydrous, 99.9% (REO)
	11185	Yttrium(III) chloride hydrate, REacton®, 99.99% (REO)
	11184	Yttrium(III) chloride hydrate, REacton®, 99.9% (REO)
	35743	Yttrium(III) chloride, ultra dry, 99.99% (REO)
	H32962	Zinc chloride, 0.7M soln. in THF
	H54398	Zinc chloride, 1.9M in 2-MeTHF
	19808	Zinc chloride, 1M in diethyl ether
	42781	Zinc chloride, 1M in diethyl ether, packaged under Argon in resealable ChemSeal® bottles
	A16281	Zinc chloride, anhydrous, 98+%
	87900	Zinc chloride, anhydrous, 99.95% (metals basis)
	41247	Zinc chloride hydrate, 99.99% (metals basis)
	35782	Zinc chloride hydrate, Puratronic®, 99.999% (metals basis)
	44198	Zinc chloride, ultra dry, 99.995% (metals basis)
	35726	Zinc chloride, ultra dry, 99.999% (metals basis)
	13694	Zinc chloride, ultra dry, 99.99% (metals basis)
	86108	Zirconium dichloride oxide hydrate, 99.9% (metals basis)
	11135	Zirconium dichloride oxide hydrate, Puratronic®, 99.9985% (metals basis)
	L14891	Zirconium(IV) chloride, 98%, cont. 1-2% hafnium(IV) chloride

12104 Zirconium(IV) chloride, Reactor Grade, 99.5+% (metals basis)
