

## Other Inorganic compounds

Inorganic oxides are used in diverse applications. Inorganic nanotubes are often metal oxides or nitrides. In recent years, inorganic oxides, predominantly as nanoparticles, increasingly find application as antimicrobials. Of particular interest is MgO, which has generated considerable activity in the field of antimicrobials.

## Additional Inorganic Compounds

In this section we list our antimonides, arsenides, carbides, germanides, selenides, silicides, sulfides, and tellurides. Plus a few other compounds.

	A17247	Aliquat® 336 TG
	36239	Aluminon, ACS
	43455	Aluminum antimonide, 99.99% (metals basis)
	14522	Aluminum arsenide, 99.5% (metals basis)
	14038	Aluminum carbide, 99+% (metals basis)
	13132	Aluminum selenide, 99% (metals basis)
	12851	Aluminum sulfide, 99+%, (metals basis)
	H27080	Ammonia, 2M in methanol
	33286	Ammonium sulfide, 20-24% aq. soln.
	40509	Ammonium sulfide, 40-44% w/w aq. soln.
	13130	Antimony(III) selenide, 99.999% (metals basis)
	12521	Antimony(III) sulfide, 98% (metals basis)
	41782	Antimony(III) sulfide, 99.5% (metals basis)
	11683	Antimony(III) sulfide, 99.999% (metals basis)
	45464	Antimony(III) sulfide, 99.999% (metals basis)
	40371	Antimony(III) sulfide, 99.9% (metals basis)
	45922	Antimony(III) telluride, 99.999% (metals basis)

	36282	Antimony(III) telluride, 99.999% (metals basis)
	12849	Arsenic(III) selenide, 99.999% (metals basis)
	43748	Arsenic(III) selenide, 99.999% (metals basis)
	45522	Arsenic(III) sulfide, 99.999% (metals basis)
	41980	Arsenic(III) sulfide, 99.999% (metals basis)
	45616	Arsenic(III) sulfide, 99.9% (metals basis)
	43340	Arsenic(III) sulfide, 99.9% (metals basis)
	41709	Arsenic(III) telluride, 99.999% (metals basis)
	41708	Arsenic(III) telluride, 99.999% (metals basis)
	17284	Arsenic(II) sulfide, tech. 90%
	12848	Barium sulfide, 99.7% (metals basis)
	A15795	Bentonite, sodium form
	A17014	Bismuth antimonide, 99.99%
	47198	Bismuth(III) selenide, 99.995% (metals basis)

	13126	Bismuth(III) selenide, Vacuum Deposition Grade, 99.995% (metals basis)
	45463	Bismuth(III) sulfide, 99.999% (metals basis)
	35834	Bismuth(III) sulfide, 99.9% (metals basis)
	44077	Bismuth(III) telluride, 99.98% (metals basis)
	14519	Bismuth(III) telluride, Vacuum Deposition Grade, 99.999% (metals basis)
	40504	Boron carbide
	10922	Boron carbide, 90+%
	47378	Boron carbide, 99+%
	35670	Boron silicide, 98% (metals basis)
	22773	Cadmium arsenide, 99% (metals basis)
	11057	Cadmium selenide, 99.995% (metals basis)
	36323	Cadmium selenide, 99.995% (metals basis)
	45456	Cadmium selenide, 99.999% (metals basis)
	A14544	Cadmium sulfide, 98%
	38342	Cadmium sulfide, 99.999% (metals basis)

45455 Cadmium sulfide, 99.999% (metals basis)

41511 Cadmium sulfide, 99.99% (metals basis)

14365 Cadmium telluride, 99.999% (metals basis)

45457 Cadmium telluride, 99.999% (metals basis)

	14367	Cadmium telluride, 99.999% (metals basis)
	14308	Calcium carbide
	89462	Calcium cyanamide, tech.
	14676	Calcium silicide, tech.
	13121	Calcium sulfide, 99.9% (metals basis excluding Sr), Sr typically 500 ppm
	43646	Calcium sulfide, 99% (metals basis excluding Mg), Mg <1%
	32472	Carbon disulfide, 99.9%
	40910	Carbon disulfide, low benzene, 99.9%
	39205	Chromium arsenide, 99% (metals basis)
	11547	Chromium carbide, 99.5% (metals basis)
	42313	Chromium carbide, 99.5% (metals basis)
	A18112	Chromium(III) antimonide, 99%
	40206	Chromium(III) telluride, 99.5% (metals basis)
	13119	Chromium selenide, 99.5% (metals basis)
	12151	Chromium silicide, 99+% (metals basis)
	40224	Cobalt(II) selenide, 99+% (metals basis)

	13114	Cobalt(II) sulfide, 99.5% (metals basis)
	14005	Cobalt(IV) sulfide, 99.5% (metals basis)
	13115	Cobalt silicide, 99% (metals basis)
	45776	Copper based methanol synthesis catalyst
	45604	Copper germanide, 99.99% (metals basis)
	45605	Copper germanium selenide, 99.99% (metals basis)
	17901	Copper(II) selenide, 99.5% (metals basis)
	42925	Copper(II) sulfide, 99.8% (metals basis)
	45660	Copper(I) selenide, 99.5% (metals basis)
	14718	Copper(I) sulfide, 99.5% (metals basis)
	13140	Copper(I) telluride, 99.5% (metals basis)
	89688	Copper powder, 5% in graphite
	12844	Copper silicide, 99.5% (metals basis)
	A13919	Diphenyl diselenide, 98%
	A18364	Diphenyl selenide, 97%
	44224	DuPont Molykote® High-Vacuum Grease
	12933	Gallium antimonide, 99.99% (metals basis)
	88458	Gallium arsenide, 99.999% (metals basis)

	45572	Gallium(III) selenide, 99.99% (metals basis)
	41538	Gallium(III) sulfide, 99.999% (metals basis)
	13387	Gallium(III) sulfide, 99.99% (metals basis)
	41881	Gallium(II) telluride, 99.999% (metals basis)
	45461	Germanium(II) telluride, 99.999%
	12567	Hafnium carbide, 99.5% (metals basis excluding Zr), Zr <1%
	12564	Hafnium silicide
	39223	Hafnium telluride, 99.5% (metals basis)
	14626	Indium antimonide, 99.999% (metals basis)
	88460	Indium antimonide, Electronic Grade, 99.99% (metals basis)
	12932	Indium arsenide, 99.9999% (metals basis)
	22651	Indium arsenide, 99% (metals basis)
	88280	Indium(III) selenide, 99.99% (metals basis)
	44835	Indium(III) sulfide, 99.98% (metals basis)
	44836	Indium(III) sulfide, 99.995% (metals basis)
	45563	Indium(III) sulfide, 99.999% (metals basis)

	89654	Iron, 5% in graphite
	36190	Iron arsenide, 99.5% (metals basis)
	14022	Iron disilicide, 99.9% (metals basis)
	31112	Iron(II) selenide, 99.9% (metals basis)
	22388	Iron(II) sulfide, 99.98% (metals basis)
	14024	Iron(II) sulfide, 99.9% (metals basis)
	17422	Iron(II) sulfide, 99% (metals basis)
	A15569	Iron(II) sulfide, tech.
	14019	Iron silicide, 99.9% (metals basis)
	12842	Iron sulfide, 99.9% (metals basis)
	36350	Lead antimonide, 99+% (metals basis)
	44916	Lead(II) selenide, 99.999+% (metals basis)
	45462	Lead(II) sulfide, 99.995% (metals basis)
	88284	Lead(II) sulfide, 99.9% (metals basis)
	A10268	Lead(II) sulfide, Pb 82% min.

	88285	Lead(II) telluride, 99.999% (metals basis)
	36317	Lead(II) telluride, 99.99% (metals basis)
	L16023	Lithium amide, 95%
	44100	Lithium deuteride, 98%(Isotopic)
	12839	Lithium sulfide, 99.9% (metals basis)
	45517	Magnesium germanide, 99.99% (metals basis)
	12837	Magnesium silicide, 99.5% (metals basis)
	45518	Magnesium silicide, 99.99% (metals basis)
	36384	Manganese aluminide, 99.5% (metals basis)
	36390	Manganese antimonide, 99.5% (metals basis)
	36385	Manganese antimonide, 99.5% (metals basis)
	12835	Manganese(II) sulfide, 99.9% (metals basis)
	13134	Manganese(IV) telluride, 99.9% (metals basis)
	36389	Manganese telluride, 99.9% (metals basis)
	13625	Mercury(II) iodide, ultra dry, 99.999% (metals basis)
	12832	Mercury(II) selenide, 99.999% (metals basis)
	22878	Mercury(II) selenide, 99.9% (metals basis)

	13483	Mercury(II) sulfide, black
	12992	Mercury(II) sulfide, black, Puratronic®, 99.999% (metals basis)
	13482	Mercury(II) sulfide, red
	36666	Mercury(II) telluride, 99.999% (metals basis)
	88244	Mercury(II) telluride, 99% (metals basis)
	12192	Molybdenum carbide, 99.5% (metals basis)
	13112	Molybdenum(IV) selenide, 99.9% (metals basis)
	12213	Molybdenum(IV) sulfide, 98%
	41827	Molybdenum(IV) sulfide, 98%
	11549	Molybdenum silicide, Mo 61% min, typically 99.5% (metals basis)
	36269	Nickel arsenide, 99.5% (metals basis excluding Co), Co 0.1-1%
	13106	Nickel(II) selenide, 99.9% (metals basis)
	13105	Nickel(II) telluride, 99.9% (metals basis excluding Co), Co 0.1-1%
	31276	Nickel on silica-alumina, catalyst

36251 Nickel silicide, 99% (metals basis excluding Co), Co 0.1-1%

35661 Nickel sulfide, 99.9% (metals basis)

45498 Nickel sulfide, 99% (metals basis)

12147 Niobium carbide, 99+% (metals basis)

	36595	Zinc telluride, 99.998% (metals basis)
	44412	Zinc telluride, 99.99% (metals basis)
	35808	Zirconium carbide, 99.5% (metals basis excluding Hf), Hf< 200ppm
	36322	Zirconium silicide, 99.5% (metals basis)

# Inorganic Hydroxides

The hydroxide moiety contains an oxygen-hydrogen bond, carrying a negative charge. Some of the inorganic hydroxides, like sodium hydroxide, calcium hydroxide, and other alkali hydroxides, are strong bases that are important industrial alkalis. Some of them, like hydroxides of zinc, aluminium, tin, beryllium, and lead, are amphoteric, as they act like both acids and bases.

Lithium hydroxide is used in breathing gas purification systems for spacecraft, submarines, and rebreathers to remove carbon dioxide from exhaled gas. Alkaline earth metal compounds, like magnesium hydroxide, calcium hydroxide, strontium hydroxide, and barium hydroxide, are strong bases. A solution of calcium hydroxide and limewater can be used to test for carbon dioxide. Soda lime, which is a mixture of NaOH and Ca(OH)<sub>2</sub>, is used as a CO<sub>2</sub> absorbent. Unlike the alkali and alkaline earth hydroxides, boron hydroxide, B(OH)<sub>3</sub>, known as boric acid, is an acid that does not dissociate in aqueous solution. Basic aluminium hydroxide is also amphoteric. Gallium hydroxide, indium hydroxide, and thallium (III) hydroxide are also amphoteric.

The hydroxide ion acts as a base catalyst in several organic transformations. Hydroxide can also act as a Lewis-base catalyst, and as a ligand. Organic reactions where hydroxide can act as a nucleophilic reagent are during amide hydrolysis, in the Cannizzaro reaction, during nucleophilic aliphatic substitution, during nucleophilic aromatic substitution, and in elimination reactions. Alkali metal hydroxides, such as sodium hydroxide, are used in the manufacture of pulp and paper, textiles, soaps, and detergents. Potassium hydroxide is used in agriculture, batteries, petroleum and natural gas refining, and manicure treatments.

	12366	Aluminum hydroxide, 76.5% min
	35576	Ammonium hydroxide, 0.1N Standardized Solution
	35614	Ammonium hydroxide, 1.0N Standardized Solution
	35575	Ammonium hydroxide, 10% v/v aq. soln.
	87903	Ammonium hydroxide, 25% NH <sub>3</sub> , 99.99% (metals basis)

# Nitrides

Nitrides are compounds of nitrogen having an oxidation state of 3-. Nitrides can be classified into three general categories: ionic, interstitial, and covalent. Alkali and alkaline earth nitrides are called as ionic nitrides. Alkaline earth nitrides are formed with the formula  $M_3N_2$  (for example,  $Ca_3N_2$ ,  $Ba_3N_2$ ,  $Mg_3N_2$ ). These compounds undergo hydrolysis to produce ammonia and the metal hydroxide. Transition metal nitrides form compounds with the formula  $MN$ ,  $M_2N$ , and  $M_4N$ . The largest group of nitrides is the interstitial nitrides. These compounds have high melting points. These are extremely hard, and usually have metallic luster and high conductivities. The nitrides of p-block elements are called as covalent nitrides. These have wide range of properties depending on nitrogen bonding (eg.,  $BN$ ,  $(CN)_2$ ,  $P_3N_5$ ,  $S_4N_4$ ,  $S_2N_2$ ).

# Carbonates

Inorganic carbonates are ionic compounds containing carbonate ( $\text{CO}_3^{2-}$ ) and metal ions. Some important carbonates are  $\text{Li}_2\text{CO}_3$ ,  $\text{Na}_2\text{CO}_3$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{MgCO}_3$ ,  $\text{CaCO}_3$ ,  $\text{BaCO}_3$ ,  $\text{Ti}_2\text{CO}_3$ ,  $\text{PbCO}_3$ ,  $\text{ZnCO}_3$ ,  $\text{CuCO}_3$ ,  $\text{Ag}_2\text{CO}_3$  and  $\text{Fe}_2\text{CO}_3$ . Group-1 and 2 elements form colorless carbonates and transition element carbonates may be colored. Most carbonate salts are insoluble except lithium, sodium, potassium, ammonium and uranium carbonates. On heating carbonates decompose to carbon dioxide and oxide.

Inorganic carbonates are used as raw materials in several industrial products/processes such as glass making, drug development, paper and pulp processing, silicates, soap and detergent production, water softener, drying agent, fireproofing, fire extinguishing compositions, clay and concrete production. Magnesium carbonate is used in antacid, table salt and tooth paste preparations. Lithium carbonate is used in batteries and essential medicines. Sodium percarbonate is used in some eco-friendly cleaning products and as a laboratory source of anhydrous hydrogen peroxide. Cesium carbonate is a base of choice for synthetic organic chemists for large number of N-alkylations of sensitive compounds; for clean oxidation of alcohols into carbonyl compounds; for Suzuki, Heck, and Sonogashira couplings.

# Inorganic Oxides

Inorganic oxides are binary compounds of oxygen with an element. Inorganic Oxides are classified into acidic or basic based on their acid-base characteristics.

Acidic oxides give an acid when combined with water. Examples of Acid oxides are Sulfurous acid, Carbonic acid and Sulfuric acid. Acid oxides are also known as acid anhydrides.

Basic oxides give a base in water. Generally Group I and II elements form basic oxides. Examples of Basic oxides are Copper (II) oxide, Magnesium oxide and Aluminum oxide.

Amphoteric oxides are metallic oxides which show both basic as well as acidic properties. When they react with an acid, they produce salt and water, showing basic properties. While reacting with alkalis they form salt and water showing acidic properties. A common example of an amphoteric oxide is aluminum oxide.

Neutral oxides which show neither basic nor acidic properties, They do not form salts when reacted with acids or bases. Carbon monoxide (CO); nitrous oxide (N<sub>2</sub>O); nitric oxide (NO) are neutral oxides.

Preparation: Inorganic Oxides can be prepared by direct heating of element with oxygen, reaction of oxygen with compounds at high temperatures, oxidation of metals and non-metals with Nitric acid.

In a periodic table, the oxides of elements in a period become progressively more acidic as one goes from left to right, Basic oxides are present on the left side and acidic oxides are found on the right side of the periodic table.

## Nitrite Salts

A salt of nitrous acid, containing the group  $\text{NO}_2^-$  is called a nitrite salt. Some examples of nitrite salts are ammonium nitrite, calcium nitrite, sodium nitrite, and potassium nitrate. Nitrites mainly decompose to  $\text{N}_2$  and  $\text{NO}$ . Nitrites may be further reduced to nitrogen by bacteria under some conditions. In blood, nitrite transforms hemoglobin to methemoglobin and is simultaneously oxidized to nitrate. Nitrite easily transforms into a nitrosating agent in an acidic environment and can react with a variety of compounds, e.g. ascorbic acid, amines, amides.

Nitrite salts are used in organic chemistry for N-nitrosation of amines. Nitrites are used in the food production industry as a food additive and preservative. Nitrites is also used in analytical and preparative chemistry, as corrosion inhibitors, and as an antidote in cyanide poisoning. Nitrites are the potential source of nitric oxide vasodilators. The nitrite ion is an ambidentate ligand and forms coordination complexes with metals. Nitrates are highly soluble and can be used as antifreeze. Cobalt complexes with varying colors containing the  $\text{NO}_2$  ligand find application in paints and dyes, and to color ceramics.

# Hydrides

Hydride (anion of hydrogen,  $H^-$ ) is a compound of anion of hydrogen with electropositive elements in the periodic table. Four main groups of inorganic hydrides are reported, covalent, ionic, transition metal and metallic hydrides. Ionic hydrides form between alkali and alkaline earth metals of group I and II metals like lithium, sodium and calcium. Transition metal hydrides usually contain complexing ligands. Metallic hydrides or interstitial hydrides are formed by transition metals/lanthanides/actinides.

## Naturally occurring mineral

Alfa Aesar is proud to offer a comprehensive line of naturally occurring minerals.

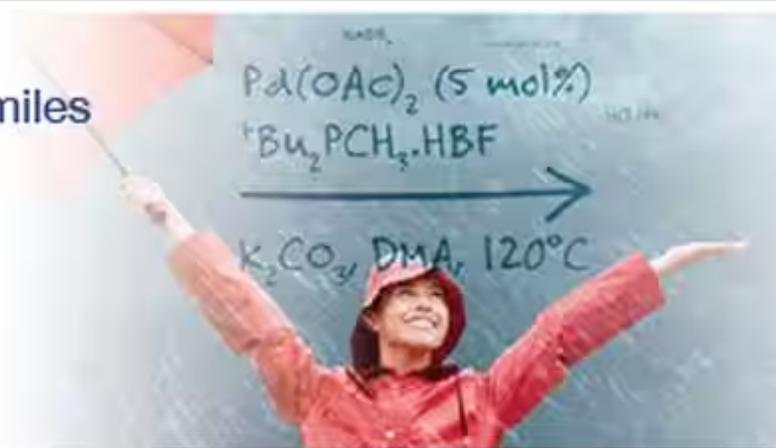

These minerals are mined and otherwise not in any way refined or processed.

Please note that we are not able to provide any analysis on these minerals. They are provided as is, so you can rest assured they are completely naturally authentic.

Less waste. More smiles

## Nitronium Salts

The class of chemical salts containing nitronium cation ( $\text{NO}_2^+$ ) are called nitronium salts. Nitronium salts are excellent nitrating agents and are superior to the mixed acids or other nitrating agents since the attacking species of nitration, nitronium cation ( $\text{NO}_2^+$ ) is readily available in the nitronium salts before the interaction with the substrate.

Nitronium tetrafluoroborate ( $\text{NO}_2^+\text{BF}_4^-$ ) and nitronium hexafluorophosphate ( $\text{NO}_2^+\text{PF}_6^-$ ) are some of the most frequently used nitronium salts for nitration of organic compounds. These salts are extremely active for the nitration of aromatic compounds and will give high yield under mild conditions. Nitronium salts have also been used in the nitration of aliphatic compounds. Nitronium tetrafluoroborate is a versatile nitrating agent for nitrogen compounds. When reacted with secondary aliphatic amines, aryl aliphatic amine, carbamate ester, diacyl amine and primary amides, nitronium tetrafluoroborate gives corresponding N-nitro derivatives. Nitronium tetrafluoroborate is also used in the nitration of alkylsilanes to give corresponding nitroalkanes.

	13151	Nitronium hexafluorophosphate

# Hydrogen Carbonates

Hydrogen carbonate, also referred to as bicarbonate, and amphoteric in nature, is an intermediate form in the deprotonation of carbonic acid and a polyatomic anion. Bicarbonate serves a crucial biochemical role in the physiological pH buffering system. The most common salt of the bicarbonate ion is sodium bicarbonate,  $\text{NaHCO}_3$ , which is commonly known as baking soda. Bicarbonates are used as fire extinguishers, chemical reagents, and in medications as buffers. Bicarbonates are widely and extensively used in huge volumes in organic synthesis, pharmaceuticals, analytical chemistry, biotechnology, and biology owing to their basicity and buffering characteristics.

Ammonium bicarbonate is used in ceramics and polymer industries. It is also useful for the synthesis of catalysts, and chrome leather tanning. The blood value of bicarbonate is useful as indicator in diagnostics on the state of acid-base physiology. Bicarbonates are often used as inactive ingredients in pharmaceutical oral and parenteral formulations to stabilize the drug, maintain pH, and improve the solubility. Commonly used hydrogen carbonates are sodium bicarbonate, potassium bicarbonate, cesium bicarbonate, calcium bicarbonate, and ammonium bicarbonate.

# Nitrate Salts

Salts of nitric acid containing the group  $\text{NO}_3^-$  are called nitrate salts. Nitrate anions form salts with a wide range of elements in the periodic table. Examples of nitrates are ammonium nitrate ( $\text{NH}_4\text{NO}_3$ ), sodium nitrate ( $\text{NaNO}_3$ ) and potassium nitrate ( $\text{KNO}_3$ ). Nitrates consist of one central nitrogen atom surrounded by three identical oxygen atoms in a trigonal planar arrangement.

Nitrates are essential plant nutrients. The main use of nitrates is as fertilizers in agriculture. Nitrates are used as oxidizing agents. Sodium nitrate is used to remove air bubbles from molten glass in the manufacturing of high quality glass. Mixtures of the molten salt are used to harden some metals. Nitrates are used in certain specialty curing processes. Nitrates have been demonstrated to inhibit platelet aggregation and to mildly lower blood pressure. In organic chemistry, a combination of metal nitrate and sulfuric acid is a strong nitrating reagent, replacing fuming nitric acid mixture with sulfuric acid.

	14579	Thulium(III) nitrate hydrate, REacton®, 99.9% (REO)
	12901	Ytterbium(III) nitrate hydrate, 99.9% (REO)
	11196	Ytterbium(III) nitrate hydrate, REacton®, 99.99% (REO)
	12898	Yttrium(III) nitrate hexahydrate, 99.9% (REO)
	11187	Yttrium(III) nitrate hydrate, REacton®, 99.99% (REO)

A16282 Zinc nitrate hexahydrate, 98%

12313 Zinc nitrate hexahydrate, 99% (metals basis)

11136 Zinc nitrate hexahydrate, Puratronic®, 99.998% (metals basis)

43224 Zirconium dinitrate oxide hydrate, 99.9% (metals basis)

# Nitrosonium Salts

Nitrosonium salts are salts containing nitrosonium ion,  $\text{NO}^+$ . Nitrosonium ion is formed by bonding of nitrogen atom to an oxygen atom with a bond order of 3 and the overall diatomic species bears a positive charge.  $\text{NOClO}_4$ ,  $\text{NOSO}_4\text{H}$  and  $\text{NOBF}_4$  are some of the examples of nitrosonium salts.

These nitrosonium salts are used in chemical reactions for several purposes, including as a convenient oxidizing agent since the byproduct,  $\text{NO}$ , is a gas and can be easily removed from the reaction with the stream of  $\text{N}_2$ , and as a diazotizing agent for aryl amine to give diazonium salts. Since the  $\text{NO}^+$  ion of nitrosonium salt is isoelectronic with carbon monoxide and its mode of coordination to transition metal is also similar to that of carbon monoxide, these salts are used as a source of  $\text{NO}$  for the synthesis of metal nitrosyl complexes from metal carbonyl complexes.

13151 Nitronium hexafluorophosphate

13149 Nitrosonium hexafluorophosphate, 96%
