

Aldehyde, Hydroxyls, Ethers, and Ketones

Hydroxyls (also referred to as alcohols) are those organic compounds that contain the group -OH attached to a carbon atom. Compounds containing hydroxyl groups have wide range of applications in almost every field of chemistry and biology. They are used as synthetic intermediates and starting materials in an enormous number of organic reactions. They also find applications in the chemical industry as solvents, cleanser, cosmetics, fuels, alcoholic beverages and for the preservation of specimens.

Alcohols

An alcohol is an organic compound in which one or more hydroxyl groups are attached to saturated carbon atoms. Alcohols are normally classified into different groups such as primary, secondary, and tertiary based on the substitutions of the carbon atom bearing the -OH group. The primary, secondary, tertiary alcohols can also be defined by the molecule containing $\text{-CH}_2\text{OH}$, -CH(OH)- and $\text{-C(OH)}_2\text{-}$ respectively. Alcohols are reactive and are capable of being converted to metal salts, alkyl halides, esters, aldehydes, ketones, amines, and carboxylic acids. Alcohols can also undergo oxidation; tosylation, esterification, pinacol rearrangement, substitutions to form alkyl halides, dehydration to form alkenes and ethers. This makes them important intermediates and reagents in organic synthesis.

Alcohols are used as solvents in reactions for dissolving chemicals which are insoluble in water, for examples perfumes, vegetable and cosmetic essences like vanilla extracts. One common application for alcohol is in hand sanitizer. There are a number of compounds in which alcohol is the main component, for example, plastics, synthetic fibers, paints, resins, magnetic film, safety glass laminate, adhesives, solvents, carpeting, insulation, refrigerants, windshield washer fluid, particle board, pigments and dyes. Pure methanol can be used as a transportation fuel, a fuel cell hydrogen carrier and also in wastewater denitrification, biodiesel transesterification and electricity generation.

Ketone Ketals

Ketals are any class of organic compounds that are geminal diethers of the formula $R_2C(OR')_2$, where R and R' represent organic fragments bonded through the carbon atoms. Examples of ketals are acetone dimethyl ketal, acetone butyl methyl ketal, acetone dibutyl ketal, 2-butanone dimethyl ketal, cyclohexanone dimethyl ketal, and 2,2'-dimethyldioxolane. In organic synthesis, ketals are useful intermediates that protect carbonyl groups of the more reactive ketones or hydroxyl groups of diols, when performing organic transformations. Solketal, a glycerol acetonide, has been used extensively in the synthesis of mono-, di- and triglycerides by ester bond formation.

L09490 1,4-Cyclohexanedione mono-2,2-dimethyltrimethylene ketal, 95%

L19795 1-Amino-4-oxocyclohexanecarboxylic acid ethylene ketal, 98%

H55069 Ketoketal, 97%

Aldehyde Acetals

Aldehyde acetals are characterized by the bonding of two oxygen atoms to a central carbon atom, bearing either two hydrogen atoms or a hydrogen atom and an organic substituent. Some examples of acetals are dimethoxymethane, dioxolane, paraldehyde, 1,3,5-trioxane, and 2-methyldioxolane. Heating the acetal in aqueous acid regenerates the aldehyde. Besides being stable against bases, acetals are also inert to many oxidizing and reducing agents. This property of acetals makes them useful as carbonyl or alcohol, in particular diol, protecting groups in organic synthesis. Acetals find use in organic synthesis for trans-acetalization reactions.

	A13841	N-Benzylaminoacetaldehyde diethyl acetal, 96%
	L01642	N,N-Dimethylacetamide dimethyl acetal, tech. 90%, stab.
	L02728	N,N-Dimethylformamide dineopentyl acetal, 98%
	L00872	Phenylpropionaldehyde diethyl acetal, 98%
	L10767	Propionaldehyde diethyl acetal, 97%
	L02814	Solketal, 97%

Ketones

Ketones are a class of compounds with the carbonyl group bonded to two other organic fragments through carbon [R(C=O)R'], wherein R and R' are organic fragments bonded through carbon]. Ketones are either pleasant smelling liquids or odorless solids. Examples of ketones are acetophenone, acetone, butanone, propanone, cyclohexanone, and cyclopentanone. They are widely present in nature (camphor, carvone, progesterone, cortisone, etc). Ketones with the alpha-hydrogen atom in acidic or basic conditions undergo keto-enol tautomerization. The keto form is more stable than the enol form.

Aldehydes

Aldehydes are a class of organic compounds which contain a formyl group, represented by $-C(=O)H$. Most of the aldehydes are colorless or pale-colored liquids with noticeable odors. The aldehydes, containing alpha-hydrogen, can exist as either a keto or enol tautomer, in which the enol tautomer is more reactive. Aldehydes generally undergo addition reactions, by losing a water molecule and therefore it is known as an addition-elimination or condensation reaction. Cyanohydrins, formed through this mechanism, are a route to the synthesis of important alpha-hydroxy acids. Aldehydes are efficient partners in the Wittig reaction for the synthesis of olefins. They are also important intermediates in organic synthesis for the preparation of alcohols, imines and amines.

Phenols

Organic compounds with a hydroxyl group directly attached to an aromatic carbon atom are called phenols. Depending on the number of phenolic units in the molecule, they are classified as simple phenols and polyphenols. Phenols are efficient partners in a variety of reactions such as electrophilic aromatic substitutions, Bucherer carbazole synthesis and oxidative de-aromatization to quinones in the Teuber reaction.

Phenols are employed in the preparation of resins, dyes, explosives, lubricants, and plastics. Phenol and its derivatives are basic building blocks for polycarbonates, epoxies, Bakelite, nylon, detergents, and numerous pharmaceutical drugs. Phenols are employed in medicinal products such as ear and nose drops, throat lozenges and mouthwashes. The substituted phenols are utilized in the dye industry. Phenol derivatives find use in the preparation of cosmetics comprising sunscreens, hair colourings and skin lightening preparations. Phenols are also wide-spread in nature. Phenols substituted with bulky groups at ortho- positions, like butylated hydroxytoluene (BHT), butylated hydroxyanisole (BHA), are endowed with antioxidant property and are used as antioxidants in many formulations such as pharmaceuticals, cosmetics, electrical transformer oil, solvents, and organic reactions.

Ethers

A class of organic compounds that has an oxygen atom interposed between the two alkyl or aryl or between an alkyl and aryl fragments are known as ethers ($R-O-R'$). The oxygen atom in ethers are more electronegative than carbon, thus the hydrogens which are alpha to the ethers are more acidic than the simple hydrocarbons. Ethers are classified into two types, simple or symmetrical and mixed or asymmetrical ethers based on the organic fragments (R and R') attached to the oxygen atom. The simple or symmetrical ethers are those which have identical organic fragments attached to an oxygen atom (diethyl ether, dimethyl ether). The mixed or asymmetrical ethers are ones which have the different organic fragments attached to an oxygen atom (methyl ethyl ether, cyclopentyl methyl ether)

Quinone

Quinones are any class of cyclic six-membered unsaturated organic compounds that have two carbonyl groups either adjacent or separated by a vinylene group. Examples include 1,4-benzoquinone, 1,2-benzoquinone, 1,4-naphthoquinone, and 9,10-anthraquinone. These coloring substances, both natural and artificial (e.g. dyes and pigments), are made up of basic units of quinone derivatives and hence play a prominent role in dyestuffs. The most distinguishing reaction of quinone is the reduction of the compound to its corresponding dihydroxy form. This feature is utilized in the popular quinhydrone electrode that is used in the determination of hydrogen ion concentration in solutions. Owing to its ability to oxidize, 1,4-benzoquinone is used in the Wacker-type oxidation, wherein the alkene is oxidized to afford the corresponding ketone.
