

Antibiotics

Antibiotics are molecules which kill or prevent the growth of microorganisms. Antibiotics work by a number of different modes of action. They typically work by disrupting cell wall synthesis, preventing nucleic acid metabolism or disturbing a microorganism's ability to synthesize proteins. Antibiotics can act on either gram-negative or gram-positive bacteria, and some are active against both. Antibiotics may also act on some yeasts, molds and mycoplasma. Major classes of antibiotics include: penicillins, tetracyclines, macrolides, cephalosporins, fluoroquinolones and aminoglycosides. These compounds are commonly used in molecular biology to select cell lines. They are also common supplements to cell culture media and buffers. Alfa Aesar provides a comprehensive line of antibiotics as well as ready to use sterile filtered antibiotic solutions.

J67080	Erythromycin, 50 mg/ml in ethanol, sterile-filtered
J62279	Erythromycin, Cell Culture Grade
J66543	Erythromycin ethylsuccinate Erythromycin ethyl succinate is used to study erythromycin-resistant <i>Streptococcus pyogenes</i> and <i>Streptococcus pneumoniae</i> . It inhibits bacterial growth by targeting the 50S ribosomal subunit preventing peptide bond formation and translocation during protein synthesis. Erythromycin resistance is commonly attributed to mutations in 50S rRNA that prevent erythromycin binding.
J60695	Ethambutol dihydrochloride
J66582	Ethionamide, 98%
J66995	Florfenicol, 98%
J66615	Flucloxacillin sodium
J66332	Flumequine, 98% Flumequine inhibits topoisomerases, preventing transcription and replication of bacterial DNA. Flumequine action on topoisomerases leads to strand breakage of bacterial chromosomes, supercoiling and resealing.
